Finasteride Prescription Uk

the daily dose should be increased every 2 weeks by increments of 20 mg/kg to the recommended daily dose of 60 mg/kg (30 mg/kg twice daily)

it decreases acid secretion and increases pepsin, mucin and bicarbonate secretion and improves microcirculation

however, if you are older than age 65 or have a serious kidney or liver disease some physicians will recommend starting with the minimal dose of 25mg

another idea i had.....could a low level sinus infection be causing the stomach acid to react adversely (ie ingesting constant bacteria and infection)
